

CLAIMS

1. Impermeable device for urinary incontinence with an approximately cylindrical shape, comprising cotton fibres covered by a composition, characterized in that the said fibres are compacted, in that the fibres forming the outer surface of the device are smooth over their entire length, and in that the composition partly or completely covering the cotton fibres is a lubricating composition, making the device impermeable and having a therapeutic and / or moisturising effect
2. Device according to claim 1, characterized in that the composition with a therapeutic effect comprises an agent chosen from among estrogenic agents, anti-microbial agents, anti-inflammatory agents, anti-viral agents and mixes of these substances
3. Device according to claim 1, characterized in that the composition with a moisturising effect is chosen from among moisturising creams.
4. Device according to claim 1, characterized in that it also comprises a removal means, the said means

being fixed to the inside and / or the outside of the cotton fibres.

5 5. Device according to claim 1, characterized in that it also comprises an applicator to facilitate placement in the organism.

6. Device according to claim 1, characterized in that its length is between about 4 and 6 cm, and preferably 5 cm.

10 7. Device according to claim 1, characterized in that its diameter is between 1 and 1.5 cm, and preferably 1 cm.
